

The background of the slide is a silhouette of a construction site at sunset. A large crane is visible on the left, and several tall structures under construction are covered in scaffolding. The sky is a mix of orange and blue, indicating the time is either dawn or dusk. The overall scene is industrial and represents the field of occupational health and safety.

Global Standards in Occupational Health & Safety (WHS)

A Guide to ILO Conventions, ISO 45001, and International Best Practices

International
Labour
Organization

The International Labour Organization (ILO)

International
Labour
Organization

- The ILO is a UN agency that sets the most significant global benchmarks.
- In 2022, the ILO elevated "a safe and healthy working environment" to a **Fundamental Principle and Right at Work**
- All 187 member states are committed to these principles regardless of whether they have ratified the specific conventions.

Core Fundamental Conventions

Convention No. 155 (Occupational Safety and Health):

The baseline for national WHS policies.
It requires employers to ensure workplaces, machinery, and processes are safe and without risk to health.

Convention No. 187 (Promotional Framework for OSH):

Focuses on "continuous improvement" of WHS through national systems and programs.

Sector & Hazard Specific Standards

Chemicals:

Convention No. 170
(Safety in the use of
chemicals).

Construction:

Convention No. 167
(Safety and health in
construction).

Mining: Convention
No. 176 (Safety and
health in mines).

Physical Hazards:
Convention No. 148
(Protection against Air
Pollution, Noise, and
Vibration).

International
Organization for
Standardization

ISO 45001: The Global Management Standard

- **ISO 45001** is the primary international standard for **businesses and organizations**.
- It is a voluntary framework used to build an Occupational Health and Safety Management System (OHSMS).

Key Elements of ISO 45001:

Leadership Commitment: Top management must take active responsibility for safety culture.

Worker Participation: Workers must be consulted on safety decisions, not just "told" what to do.

Risk Management: Focuses on identifying hazards *before* they cause injury (proactive vs. reactive).

The PDCA Cycle: Uses the **Plan-Do-Check-Act** model to ensure safety processes are constantly audited and improved.

Regional and Influence-Based Standards

EU Framework Directive (89/391/EEC): The foundation for safety law across Europe, requiring risk assessments for every job role.

Covers: Safety of Workers, Prevention of Accidents, Protection of the Health

OSHA (USA): While specific to the US, OSHA standards for "General Industry" are often used as best-practice templates by multinational companies operating in regions with weak local laws.

standards in industries like construction, manufacturing, and healthcare.

GHS (Globally Harmonized System): An international standard for labeling and classifying chemicals (those red-and-black diamond symbols you see on cleaning or industrial supplies).
